Deploying Jenkins in public cloud
Many public cloud vendors provide their own Jenkins installation guides and packages. The guides provide instructions to deploy, maintain, and upgrade on the specific public cloud. Such guides may be used to quickly deploy Jenkins and, in many cases, to get a controller preconfigured to be used within the public cloud (e.g. bundled plugins, integrations with public cloud services, etc.).

Freestyle project
This is the central feature of Jenkins. Jenkins will build your project, combining any SCM with any build system.
Pipeline
Orchestrates long-running activities that can span multiple build agents. Suitable for building pipelines (formerly known as workflows) and/or organizing complex activities.
Multi-configuration project
Suitable for projects that need a large number of different configurations, such as testing on multiple environments, etc.
Folder
Creates a container that stores nested items in it. Useful for grouping things together. Unlike view, which is just a filter, a folder creates a separate namespace, so you can have multiple things of the same name as long as they are in different folders.
Multibranch Pipeline
Creates a set of Pipeline projects according to detected branches in one SCM repository.
Organization Folder
Creates a set of multibranch project subfolders by scanning for repositories.
